Abstract

Teacher education in the digital era requires innovative approaches that ensure continuous skill development and instructional effectiveness. AI provides dynamic platforms where teachers can access customized professional development resources, participate in interactive workshops and receive instant feedback on lesson planning and assessment strategies. Such technologies enable educators to engage in self-directed learning. Furthermore, AI also supports reflective practice by generating analytics on classroom engagement and student outcomes. In other words, the integration of AI in teacher education not only enhances efficiency but also promotes innovation and sustained professional growth in the 21st century.
